

Data Handling Standard

Purpose

This standard governs how patient data is stored, retained, and accessed within the care-coordination system.

Synthetic data notice

All patient, encounter, eligibility, appointment, and referral records in this environment are synthetically generated for development and evaluation purposes. No record in this environment corresponds to a real person.

Retention

- Session memory (the current conversation) is retained for 30 days after the last message, then purged.
- Long-term patient memory (summarized interaction history) is retained for the duration the patient remains an active member of the clinic, then purged 1 year after their last visit.
- Human-escalation queue entries are retained for 2 years for audit purposes.

Access tiers

- **Automated assistants** may read intake, eligibility, appointment, and referral records needed to answer the current request, and may write new appointments, referrals, and flag-for-human entries.
- **Human care coordinators** may read and amend any record.
- **Clinicians** additionally have access to referral clinical notes.

De-identification

Any data exported for analytics or model evaluation must have direct identifiers (name, phone, email, street address) removed or replaced with synthetic equivalents before export.
